

Deriving the URL for a Results Web Page.

Background:

This document describes how to determine the web-site address (URL) from Site Manager's settings.

URL Structure:

The format of a TopYacht Site Index webpage URL takes the form of:

https://myclub.com.au/results/2021/otb_club_season/index.htm,

with the slash (/) character being the separator for different server folder names.

The <https://myclub.com.au/results/> is the **Domain Name**, and 'cast in concrete' by the IS¹P and will not change for a given Club (unless they have a special event domain name).

Proxy Server	
Club Results Folder	2021
Passive Mode	<input checked="" type="checkbox"/>
Manual Upload	<input type="checkbox"/>
Event Folder and Files	
Event Folder	otb_club_season
Event Index (lists Series)	index
Display Template	site-index-template16.htm

The [index.htm](#) is optional. Most web servers will 'assume' a file name of 'index.htm' if omitted.

Note:

- Every character in the URL is case sensitive. As such OTB_club_season is a different URL, as is Otb_club_season, oTb_club_season, otb_Club_season, etc
- Site manager 'takes care of' all the folders further down the chain. After setting them up on the internet series page, do not change them. They are transparent to the end user
- It is recommended to keep all file and folder names lower case. This is a file server standard protocol.
